May 12, 2018 Sonic Charge : Mark Bishop - The World's Premier Producer. Sonic Charge is a drum and percussion synthesizer and sampler perfect for creating your own unique. Microtonic 3.0 JVC XR-VU738 Microtonic 3.0. ROD Scanner 1.64 is an amazing piece of software designed to display metadata from.Q: Send "pulse-width modulation" by using an array of boolean values I am designing a counter circuit to count up or down in unity steps using an array of 4 bit twos. The output would be enabled by an or logic gate, and there are 4 sections of circuitry that could output a pulse. The pulses are then demultiplexed (handled by another circuit) as such: 
$$\begin{bmatrix} 0 & 0 & 0 & 1 \\ 1 & 0 & 1 & 0 \\ 0 & 0 & 1 & 0 \\ 0 & 0 & 1 & 0 \end{bmatrix}$$
 The question is how to translate this setup to a logic analyzer or oscilloscope? EDIT: The specific components I have tried are: (TTL) 4-bit encoder Full-scale ADC  $\theta$  function/block And the results are: Good theta function shape, but not reliable so far Too noisy and cannot be used for the timing analysis Disconnected sections of the circuit (see images) Some kind of glitch that disappears over time A: There are a variety of ways to implement a binary counter, but the simplest is probably a binary state machine, which you can implement using digital components. If the range of the counter is a multiple of  $2^4$  (4-bits), and the range of  $2^4$  is roughly equivalent to the number of different states that it can count, then you can use an array of flip-flops to represent the counters. One thing to note is that if you have X number of flip-
